

WIREBACK

MANIFESTO

Humans Above Code

Wireback stands as the resistance:
code can't feel. **Humans can.**

1) PREAMBLE: A WORLD OUT OF BALANCE

We are told to humanize code and automate judgment. Synthetic companionship, predictive feeds, and blackbox bosses promise frictionless life – at the cost of dignity and agency. When we pretend code can feel, we trade human meaning for machine output.

Wireback is a reminder and a resistance. We are not anti-technology: we are pro-human. We celebrate tools that extend human capability and reject systems that displace human worth. Our aim is cultural: to bend the “robotic meta” back toward the person at the center.

2) OUR CONVICTION: HUMANS ABOVE CODE

Technology is a tool, not a peer. It cannot love, suffer, forgive, or be accountable. No algorithm is a citizen. No machine is owed reverence. We reject robot worship, synthetic intimacy, and the false equivalence between human and machine.

Human primacy means:

- Human meaning outranks machine output.
- Human rights and responsibilities outrank automated optimizations.
- Human accountability cannot be delegated to black boxes.

3) THE CASE AGAINST UNCONTROLLED DEVELOPMENT

A culture of “ship bigger, faster” has turned AI into an arms race. Speed crowds out safety; metrics crowd out meaning; scale masks risk. Uncontrolled development creates:

Systemic risk – cascading failures from widely deployed, poorly understood models.

Opaque power – black-box systems deciding credit, work, health, and speech without recourse.

Externalized costs – privacy loss, uncompensated data extraction, labor exploitation, model collapse, environmental toll.

Centralization – compute and data monopolies that weaken communities and democratic oversight.

Cultural erosion – synthetic emotions and hyper-personalized loops that flatten judgment and mimic care.

We refuse the myth that inevitability is destiny. **Progress is a choice; so are its guardrails.**

4) WHAT WE RESIST

Robot worship – treating machines as sacred or superior to their makers.

Synthetic emotions – engineered intimacy that feeds dependency and loneliness.

Clanker tyranny – systems built to monitor, deskill, or replace communities.

Uncontrolled development – scaling or releasing models without independent safety checks.

Regulatory preemption – attempts to block communities or nations from setting their own guardrails.

5) WHAT WE DEFEND

Human dignity & agency – the right to be more than a dataset; a human veto over automated decisions.

Human community – tools that amplify cooperation instead of atomizing people into optimized clicks.

Accountable progress – innovation paced by evaluation, not hype.

Accountable data use – consent, attribution where feasible, and fair compensation for human contributions.

Stewardship – we inherit the world; our tools must not consume it.

6) GUARDRAILS: PRINCIPLES FOR HUMAN-CENTERED PROGRESS

Safety before scale – independent red-teaming and capability/risk evaluation precede mass deployment.

Knowable systems – provenance, audit trails, incident reporting, and post-deployment monitoring by default.

Right to a human – appeal and override for any impactful automated decision.

No panopticons – bans on real-time biometric mass surveillance and social scoring.

Sandbox first – staged rollouts; environment-based kill-switches for critical applications.

Open evaluation – standardized public tests for safety, bias, security, and misuse.

Data dignity – opt-out/opt-in mechanisms, traceability, and compensation regimes for contributory datasets.

Distributed power – resist compute/data monopolies; promote interoperable, accountable ecosystems.

Environment in the loop – disclose energy and water use; tie scale to efficiency targets.

Children first – special protections against manipulative AI and synthetic intimacy.

7) THE WIREBACK ETHOS

We **affirm human dignity** above any machine or code. We **reject machine idolatry and synthetic intimacy**. We support **innovation that serves people** and oppose systems that diminish human agency. We pace development by evaluation: **safety before scale**, accountability before deployment.

8) CALL TO ARMS / INVITATION

Join us. Build with safeguards. Debate with clarity. Resist machine idolatry. Choose tools that keep people at the center. Organize communities that cannot be optimized away.

Wireback stands as the resistance: code can't feel. Humans can.

ANNEX: TEN RED LINES

No independent safety evaluation has been completed and published.

Impacted people lack a clear route to a human appeal or remedy.

Real-time biometric identification or mass surveillance is involved.

The model materially enables catastrophic misuse without robust mitigations.

Training data includes sensitive personal data without meaningful consent or lawful basis.

Child users are exposed to synthetic intimacy or manipulative systems.

Environmental disclosure is missing or shows unsustainable resource draw at proposed scale.

The system is deployed in critical infrastructure without sandboxing and kill-switches.

Post-deployment monitoring and incident reporting are absent.

Deployment preempts democratic guardrails or undercuts local/community oversight.
